

ownCloud LDAP/AD Integration

Leverage existing authentication & group management systems to simplify administration

Whether managing 100 or 100,000 users, IT managers know that centralized user management is critical for ongoing operations. For this reason, ownCloud integrates with existing user directories, Active Directory (AD) and Lightweight Directory Access Protocol (LDAP), allowing admins to easily provision and authorize users, automatically remove inactive members, set directory paths, maintain group memberships and more.

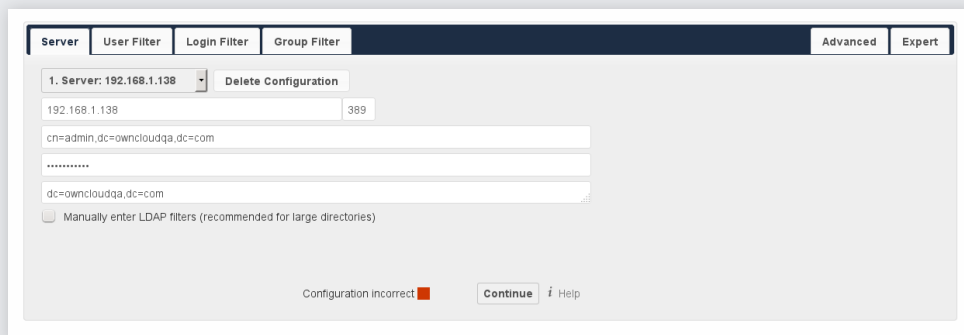

As users login to their ownCloud instance with existing user names and passwords, their credentials and attributes are refreshed, and their access privileges set.

For those users outside the directory with whom files need to be shared, such as suppliers and partners, ownCloud allows administrators to manually add and monitor local accounts.

Capabilities

Using the ownCloud integration wizard, admins can integrate with existing AD/LDAP authentication and authorization tools. Policies are maintained as past investments are leveraged to meet enterprise processes and requirements.

- Administrators can easily determine access to ownCloud files based on users and/or groups.
- ownCloud can connect to multiple directories through a single ownCloud interface.
- ownCloud automatically attempts to connect to a pre-determined AD/LDAP backup server when the primary server cannot be accessed.
- Policies and attributes such as user quota, avatars, email addresses and more can be set up in just a few clicks.

Server User Filter Login Filter Group Filter Advanced Expert

Benefits

- Leverage existing investments in user directories
- Minimize administrative overhead for user and group management
- Establish user-specific, group or universal file sharing policies
- Streamline the user experience by passing through existing credentials for login
- Maintain IT control and visibility with logging and auditing
